

PORTFOLIO SITE MAP

This is my portfolio sitemap:

Home

- Hero Section
- Featured Projects
- About Me
- Skills
- Contact

My goal is to convince recruiters that I can build modern AI and full-stack applications and encourage them to contact me.

Please pressure-test this sitemap.

Tell me:

1. Is anything unnecessary?
2. Is anything missing?
3. Will this effectively support my proof statement?
4. What would you improve?

Show less

Let me pressure-test this like a recruiter skimming for 30 seconds, not like a designer admiring a wireframe.

1. Is anything unnecessary?

Not really unnecessary, but **"Hero Section" and "Featured Projects" being separate top-level sitemap items** is a bit misleading — Hero is just the top of Home, not a separate destination. That's a minor labeling issue, not a real problem.

The bigger issue: your sitemap is *flat*. Everything lives on one page (Home). That works for a short portfolio, but it means every claim you make ("I can build full-stack AI apps") has to be proven in a few scroll-lengths, with no room for depth.

2. What's missing?

This is the real problem. Your sitemap proves you *exist*, not that you can *build*. To convince a recruiter you can build "modern AI and full-stack applications," you need:

- **Individual Project Pages/Case Studies** — this is the single biggest gap. A "Featured Projects" section with cards linking to nothing means recruiters see a screenshot and a GitHub link, not your thinking. A dedicated case study per project (problem → your approach → architecture → challenges → result) is what actually proves engineering skill.
- **Resume/CV (downloadable PDF)** — recruiters often want this instantly, not buried in Contact.

- **Blog/Writeups (optional but powerful)** — even 2-3 technical posts ("How I designed the DB schema for X") show communication skill, which backend/AI roles value highly.
- **Tech Stack context, not just a Skills list** — "Python, FastAPI, React" as a list proves nothing. Tying skills to *where you used them* proves something.

3. Will this support your proof statement?

Partially. Right now your sitemap is built to **describe** you, not **prove** you. A recruiter reading "About Me" and "Skills" learns facts about you. They don't get *evidence*. Evidence lives in project depth — architecture decisions, trade-offs, what broke and how you fixed it. That's what separates "knows Python" from "can build backend systems."

4. What I'd improve — revised structure

Home

- └─ Hero Section (clear one-liner: what you build + for whom)
- └─ Featured Projects (3 max, each links to a case study page)
- └─ Skills (grouped by category: Backend / AI / Tools – not a flat list)
- └─ About Me
- └─ Contact (with resume download + email/LinkedIn, low friction)

Project Case Study (template, one per featured project)

- └─ Problem statement
- └─ Architecture / tech stack (diagram if possible)
- └─ Key technical decisions (why FastAPI over Flask, why this DB, etc.)
- └─ Challenges + how you solved them
- └─ Live demo + GitHub link

Resume (PDF, linked from Hero and Contact)

One more thing worth asking yourself before you build this: which 2-3 projects will you feature, and do they actually *demonstrate* backend/AI skill (auth, databases, API design, deployment) — or are they tutorial-level CRUD apps? The sitemap structure won't save you if the projects themselves don't back up the claim. Want to tell me your current project list so I can help you pick the strongest 2-3 to feature?

Computer Science Learning Assistant

This project is configured to assist me with learning programming, understanding backend development concepts, preparing presentations, debugging code, and improving my academic productivity.

How can I help you today?

Files

Add PDFs, documents, or other text to reference in this project.

Set project instructions

Provide Claude with relevant instructions and information for chats within Computer Science Learning Assistant. This will work alongside your [profile instructions](#) and the selected style in a chat.

I am a second-year Computer Science Engineering student.
Explain concepts in simple and beginner-friendly language.
Use Python examples whenever possible.
Help me understand concepts instead of only giving answers.

Current goals:

- Learn Python Backend Development
- Improve programming skills
- Build real-world projects
- Prepare technical presentations.

When I ask programming questions:

- Explain the logic first.
- Then provide the code.
- Mention common mistakes if any.
