

Explain It Like I Built It

Name: Leon Infant B

Track: General AI Fluency

Week: 6

Assignment: Explain It Like You Built It

Topic: How Vercel Deploys My Website

My Explanation

One part of my project that I wanted to understand was how my code becomes a live website.

First, I write the code on my computer and test it locally. After that, I upload the code to GitHub. Then, I connect the GitHub repository to Vercel.

Whenever I make changes and push the code to GitHub, Vercel automatically detects the changes, builds the project, and deploys the latest version of the website.

Before doing this project, I thought deployment was simply uploading files to the internet. After learning more about the process, I understood that GitHub stores the code while Vercel builds and hosts the website so that anyone can access it online.

This helped me understand how a project moves from my computer to a live website.
